Dallas, TX 75275-0496, USA

Dear Hiring Committee:

I am applying for the Postdoctoral Research Fellow position in the CLICCS on *Renewables and carbon offsets in the Global South: Impacts and social conflict*. Currently, I am a PhD candidate in Economics at Southern Methodist University, specializing in Applied Microeconomics with an emphasis on Culture, Gender, and Political Economics. I expect to complete my degree by May 2026.

As a Spanish national, my family and I are eager to **return to Europe** so our newborn daughter can grow up immersed in European culture. We are seeking a community with a safe learning environment, a key factor in our decision to **leave the United States**.

My research explores how entertainment media both reflects and shapes economic behavior. I develop novel methods using generative AI to extract cultural values from TV shows and test how these values affect individuals' behaviors and attitudes.

My job market paper "Does Watching Women Work, Work?" provides causal evidence that teenage exposure to telenovelas featuring empowered female characters increases women's subsequent labor force participation. The effects are driven exclusively by portrayals of women in non-traditional careers and narratives that frame empowerment with joy or anger. A second paper shows that telenovelas focused on inequality reduce support for redistribution by downplaying or trivializing issues of economic disparity. My future work will generalize this approach to measure broader cultural values and use AI to analyze diverse media for a comprehensive study of culture.

My commitment to interdisciplinary research aligns closely with CLICCS's mission to investigate the socioeconomic and environmental dimensions of climate change. Drawing on my expertise in quantitative methods, demonstrated through my AI-driven analysis of cultural impacts on economic behavior, I am well-prepared to contribute to multi-wave panel surveys focused on Sub-Saharan Africa. In addition, I have previosult worked with conflict datasets such as the GDELT project. This synergy positions me to effectively advance the postdoctoral fellowship's goals.

Sincerely,
Javier Gonzalez

JAVIER GONZALEZ

Education

2021 – **Ph.D in Economics**
Southern Methodist University, USA

2015 – 2020 **B.A. and M.A. in Economics**
Universidad Adolfo Ibáñez, Chile

Research

Research Interests: Cultural Economics, Gender Economics, and Political Economy.

Working Papers

1. **JMP:** "Does Watching Women Work, Work?: The Effect of Mexican Telenovelas on Female Labor Participation"

   Abstract: I study the effect of female empowerment in media on female labor market outcomes using Latin American telenovelas. Using generative AI, I construct a Female Empowerment Index (FEI) for these TV shows from 1960 to 2024. I show that FEI exposure during the impressionable years increases the likelihood of labor force participation among Latin American women. To identify the causal effect of FEI exposure, I implement an instrumental variables strategy using detailed data on television signal coverage in Mexico. The causal estimates confirm the positive effect of FEI exposure, with an effect size comparable to previous studies. Furthermore, FEI changes account for a significant fraction of the aggregate increase in female labor force participation observed over this period. Moreover, both the emotional framing of narratives and the types of jobs depicted play an important role in shaping the effects.

2. "Drama and Redistribution: The Impact of Telenovelas on Preferences for Redistribution in Latin America"

   Abstract: This paper examines how telenovelas depicting inequality affect support for redistribution in Latin America. Using a novel dataset of telenovelas aired from 1960 to 2024 in the region, I employed three Natural Language Processing methods to identify inequality telenovelas. My analysis focuses on instances where a new inequality telenovela is introduced during the LAPOP's fieldwork, ensuring that no other inequality telenovelas are simultaneously airing. Consistently, I observe a 4% reduction in support for redistribution following exposure to such telenovelas. These narratives seem to misrepresent the problems of inequality, portraying fewer issues than are present in reality, making individuals adjust their policy priorities. This study provides evidence of how entertainment media can shape the perceptions of inequality, thereby influencing policy preferences.

"Trade and Ethnolinguistic Differences: A Replication and Extension" joint with Ömer Özak. Economic Inquiry, 2025.
https://onlinelibrary.wiley.com/doi/10.1111/ecin.13269

Abstract: We revisit the role of trade on long-run inter-ethnic linguistic differences. Dickens (2022) hypothesized that neighboring languages are more similar when agriculture provides potential gains from inter-ethnic trade. Since his empirical approach confounds inter- and intra-ethnic trade, we replicate his main analysis using improved measures of potential inter-ethnic gains from trade. Our results confirm the role of trade in inter-ethnic linguistic differences while showing the difficulty of disentangling the role of inter- versus intra-ethnic trade. We also provide an open-source computational framework to replicate both sets of results, which others can use to produce original replicable economic research.

Abstract: We quantify the aggregate costs of a discriminatory restriction against women in the access to business resources. To do so, we develop a general equilibrium model with an endogenous size distribution of production units, which are run by either female or male entrepreneurs. In this setting, we introduce a distortion that limits the amount of capital that women can use to run their businesses. We calibrate the model to match data from benchmark economies that exhibit relatively egalitarian labor market results between women and men, except in entrepreneurship. Our counterfactual analyses show that a gender-specific capital constraint causes an output loss between 14% and 28% and a fall in aggregate productivity between 12% and 20%. Furthermore, we show that most of the output loss is accounted for by a fall in total factor productivity. Lastly, we show that the aggregate cost of the distortion is mainly triggered by preventing the most skilled women from running bigger businesses, and not the exit of women from entrepreneurship.

Research Statement

Entertainment media (e.g., television shows, films, books, and music) are more than entertainment products. As a group, they reflect the cultural norms, identities, and values of the societies that produce them. Yet media can also be a powerful force for change. A single telenovela can drive cultural change by introducing new social issues that challenge the status quo. My research explores this dual role as a cultural mirror that reflects societal values and a driver of social change that shapes economic behavior. My core contribution is the development of novel methods using generative artificial intelligence (AI) to transform unstructured narratives into structured data for rigorous econometric analysis. I apply this framework to Latin American telenovelas, whose deep cultural penetration provides an ideal setting to identify the causal effects of media exposure on real-world economic and social outcomes. Ultimately, this approach offers a new, high-frequency, and scalable methodology for the empirical study of culture and its influence on human behavior.

Job Market Paper In "Does Watching Women Work, Work? The Effect of Television on Female Labor Outcomes," I provide causal evidence that media can be a powerful tool for closing gender gaps. To measure the content of these narratives, I developed a novel Female Empowerment Index (FEI) by applying a generative AI model to the synopses of nearly 2,000 telenovelas. The FEI is based on an augmented Bechdel-Wallace test and includes questions about the employment status of female characters. To overcome endogeneity concerns, I employ an instrumental variable strategy in Mexico that leverages quasi-random variation in television signal loss determined by physical topography. The central finding is that a 10% increase in FEI exposure (20 units) leads to a 4% relative increase in the likelihood of labor market participation (2 percentage points), accounting for a sizable share of female labor force participation growth in Mexico from 2010 to 2020. The effect is driven exclusively by portrayals of women in non-traditional careers and narratives that frame empowerment with positive emotions, demonstrating that how empowerment is portrayed is important.

A second paper, "Drama and Redistribution: The Impact of Telenovelas on Preferences for Redistribution in Latin America," complements this work by showing that telenovelas depicting inequality lead to a counterintuitive decrease in support for redistribution. This study's methodological contribution lies in the comparison of multiple Natural Language Processing (NLP) techniques to identify social class conflict in telenovelas. I compared (i) a dictionary-based approach, (ii) a vector embedding model, and (iii) a zero-shot classification using a generative AI model (ChatGPT). The ChatGPT model outperformed the others in accuracy (74%) and precision (80%). The analysis reveals that exposure to inequality telenovelas reduces support for redistributive policies by 4%. This is because the narratives often

https://jjgecon.github.io

misrepresent the experiences of marginalized groups, framing them in ways that downplay systemic issues.

My future research will be dedicated to expanding this methodological pipeline. I plan to scale the measurement of cultural values across multiple forms of media worldwide, moving beyond gender and inequality to include other economically relevant values such as community trust, attitudes towards immigration, and environmental protection. Such large-scale data assembly and validation naturally create a collaborative environment. Building on my experience managing research assistants, this work will provide ideal opportunities for undergraduates to gain hands-on experience, serving as human coders to collect data and benchmark AI model performance.

The most innovative step in this research agenda is to move beyond text, leveraging recent breakthroughs in multimodal generative AI to analyze visual and auditory data directly. This expansion will allow the project to include cultural products like movies, books, and music, which transmit essential cultural messages through images and sounds, not just text. Thanks to rapidly advancing AI, state-of-the-art multimodal models such as GPT-4o and Google's Gemini can now process text, images, and audio simultaneously. Applying these tools will enable a far more complete and nuanced extraction of cultural values from these rich media forms.

Lastly, while my research has so far explored the demand side of media, a compelling future direction is the supply side: how producers of these media types decide which narratives to create and disseminate. This new agenda will investigate the extent to which political environments shape media content and whether producers tend to conform to the status quo or push the boundaries of social norms.

My research agenda is driven by a central goal: to show that the narratives in our media have a tangible impact on people's economic lives. Ultimately, this work argues that behavioral change is not only achieved through laws and policies, but also by transforming the very stories we tell ourselves.
